

As manufacturer of safety equipment, the Cobianchi Liftteile AG company is responsible for the design and manufacture of the Cobianchi PC30DA/PC60DA progressive safety gears.

In order to make the production, the distribution, and the maintenance of our progressive safety gears and brake devices easier for the manufacturers of the framework and for the installation companies, these operating instructions have been established.

These operating instructions document the standard versions PC30DA for installation width 180/240mm and PC60DA with installation width 240mm. If your installation type differs from the versions described in these instructions, please contact your technical office or the responsible construction department.

In the following you will find important notes, which if properly observed will contribute to an impeccable installation and operation.

The following three drawings have to be enclosed with these instructions:

Drawing no.	Brake type	Front view, top view, side view
30DA-BA01-2	PC30DA installation width 180/200mm	Assembly drawing FV with Pos. no.
30DA-BA01-6	PC30DA installation width 240mm	Assembly drawing FV with Pos. no.
60DA-BA01-2	PC60DA installation width 240mm	Assembly drawing FV with Pos. no.

These operating instructions consist of some pages of text (number depending on the language) and three drawings. Customer-specific solutions may require deviating installation sequences. The progressive safety gears and the brake devices can be installed at the top of or underneath the cabin, considering the position of the connection shaft and the lifter rope engagement. For detailed information, please refer to our technical documentation.

Subject to deviations from the standard versions described here.

To be observed prior to the installation:

The two types PC30DA and PC60DA are equipped as progressive safety gear downwards in combination with brake devices upwards. One pair (basic unit) consists of two adjusted and sealed green safety gear heads (Pos. 1). They can be ordered with top lifter rope engagement or bottom lifter rope engagement. It has to be checked that the descriptions "up" and "down" on the wedge guide plates (Pos. 11) correspond to the facts. Note: The safety gear heads (Pos. 1) must not be installed rotated by 180 degrees, upside down. All performance specifications on the type plates refer to the use in pairs. The serial numbers are embossed on the safety gear heads (Pos. 1). These numbers must correspond to the serial number on the type plates attached and enclosed and must be able to be allocated to the serial number of the installation. If this is not the case, then a mistake has been made and it is necessary to refer back to the purchasing department, your own stores department or directly with the manufacturer.

1. Assembly

1.1. Assembly and alignment of safety gear heads

As a standard, delivery is made as basic unit (two green safety gear heads, Pos. 1), fully mounted with sealed adjustment. The following accessories are available on request: four gusset plates (Pos. 3), two support plates (Pos. 6), one lifter on the left and right (Pos. 2), stop-trigger bushing (Pos. 8) and one limit switch (Pos. 7). The trigger bushing (Pos. 8) and the limit switch (Pos. 7) are mounted on the safety gear rope side. The installation of the safety gear heads (Pos. 1) in the safety gear frame in any case has to be made using four bearing shafts (Pos. 13). The bearing shafts (Pos. 13) and the mounting holes in the housings should be greased.

If gusset plates (Pos. 3) are provided, they must be screwed to the frame using an adequate number of M12 or M16 screws. Secure absorption of the torque acting on the frame structure via the gusset plates (Pos. 3) during the brake process must be ensured.

The green safety gear heads (Pos. 1) are secured in a neutral position by means of the pressure springs (Pos. 15) on the side. For each head (Pos. 15) one pressure spring (Pos. 15) is mounted to one bearing shaft (Pos. 13), on the **brake wedge side** (Pos. 10). The M6 set screw (Pos. 14) on the opposite side is used to adjust the position of the safety gear heads (Pos. 1) with respect to the rail. Recommendation: Distance fixed brake shoe (Pos. 12) to guide rail running surface 2.0mm. The running surface width of the brake shoes (Pos. 12) must not be below the minimum value. For correct installation, the distance from the safety gear housing bottom to the rail head front side is normally 3-4mm. This distance should be centred relative to both safety gear housings, using a depth gauge. If necessary, re-adjust cabin guide shoes.

1.2. Mounting of connection shaft between safety gear heads/support plates

The double wedge safety gears described here are designed for an externally positioned connection shaft. The shaft itself is not within our scope of supply. Please use a structural steel tube 20x20x2.5 or 3mm according to DIN2395-3. For the respective length of the connection shaft refer to drawings enclosed. Mounting of the support plates (Pos. 6) has to be made according to the drawings enclosed. Note: The position of the connection shafts must correspond exactly to the indicated position. The shaft is inserted in the two support plates (Pos. 6) with a stop bushing (opposite safety gear rope side) and a triggering bushing (Pos. 8) on the safety gear rope side.

1.3. Mounting of PC30DA torsion springs

For installation width 180mm, the PC30DA safety gear is equipped with **one** double-arm, six-coil torsion spring (Pos. 4) **on the safety gear rope side**. For installation width 240mm **one** double-arm, five-coil torsion spring is provided for the PC30DA safety gear **on the safety gear rope side**. The spring **must** be mounted **on the safety gear rope side** in order to prevent excessive torsion of the connection shaft. Tip for initial assembly: The arms of the torsion spring (Pos. 4) are tensioned (crosswise) during assembly. Do not tighten the bolt in the eye of the torsion spring (Pos. 4) until tensioning has been completed.

1.4. Mounting of PC60DA torsion spring

The PC60DA is equipped with **two** torsion springs (Pos. 4a/b). A double-arm, five-thread torsion spring (Pos. 4a) is installed **on the safety gear rope side** and a one-arm, six-thread torsion spring (Pos. 4b) is installed **on the opposite side of the safety gear rope**. In the case of the PC60DA, during upwards braking both springs are tensioned, and during downwards braking only the torsion spring on the safety gear rope side (Pos. 4). Tips for initial assembly: The arms of the torsion springs (Pos. 4a/b) are tensioned (crosswise) during assembly. Do not tighten the bolts in the eye of the torsion spring (Pos. 4a/b) until tensioning has been completed.

1.5. Mounting of lifter

The lifters (Pos. 2) are connected to the brake wedges (Pos. 10) by means of the eyebolt (Pos. 16). Please observe the correct order: 1. Put lifter (Pos. 2) with elongated hole over eyebolt (Pos. 16), 2. Slide washer over eyebolt (Pos. 16), 3. Slide pressure spring over eyebolt (Pos. 16) up to washer and slightly press spring together 4. Loosen locking nut until eyebolt (Pos. 16) protrudes from nut by approx. one turn. Then insert connection shaft through support plates (Pos. 6) and lifter (Pos. 2) and position in the support plates by means of the stop and triggering bushing (Pos. 8). To make it easier to insert the connection shaft in the lifter (Pos. 2) slightly lift brake wedges (Pos. 10). Then check that all bolts, nuts, and headless screws of the torsion spring (Pos. 4) are tightened and that the **brake wedges (Pos. 10) of both safety gear heads (Pos. 1) synchronously stop at the guide rail when the speed limiter is activated and have the same vertical position when in open position/neutral position. In the case of great centre distances the connection shaft has to be reinforced.**

1.6. Mounting for safety-limit switch

Screw limit switch (Pos. 7) to the support plate (Pos. 6) on the safety gear rope side and check that the triggering bushing (Pos. 8) securely activates the limit switch (Pos. 7) in both directions up/down through the rotation of the connection shaft.

1.7. Type plate

Before attaching the enclosed type plate in a clearly visible position of the frame, the intended surface must be cleaned and be completely dry. The adhesive surface of the type plate must not be touched over a large surface. After adhering press firmly.

1.8. Indicating label for oiled rails

Every progressive safety gear or brake device for use with oiled rails is supplied with a yellow indicating label. This should be attached in a clearly visible position (e.g. on rail oiler). Only an ordinary machine oil of the viscosity class ISO VG 68-150 must be used without any extreme-pressure additives (lubrication oil C according to DIN 51517, part 1). Because lubricating oils for gearboxes, engines or hydraulic units frequently contain additives, they are not suitable for this application.

2. Connection

Wire limit switch (230V, 4A) (Pos. 7) and check function.

Connect safety gear rope with rope end connections of safety rope connector (Pos. 9) at lifter (Pos. 2).

The release force at the lifter (Pos. 2) required for the safety gear to engage is maximally 150-250N. It must be ensured that the tensile force in the limiter rope generated by the released speed limiter is at least 2 times the force required for the safety gear to engage (however, at least 300N)

3. Commissioning

Note: To be observed prior to the first safety gear test:

In all cases, dirt, rust-protection, and eventual paint coats have to be removed from the guide rail running surfaces. This is made best using cold cleaning agents or brake disk cleaning agents.

For oiled rails, lubrication oil C according to DIN 51517, part 1 recommended according to yellow label or equal should be used.

4. Maintenance

If the progressive safety gears have been correctly installed, then the maintenance is limited to the following checks:

4.1. Condition of rails:

according to above commissioning instruction

4.2. Triggering linkage:

Synchronous response of draw-in lifters (Pos. 2), connection without any play through connection shaft, free movement of lifters (Pos. 2) and brake wedges (Pos. 10) in the respective direction.

4.3. Limit switch:

Correct electrical/mechanical functioning, actuation ensured

4.4. Safety gear heads:

centred, clean

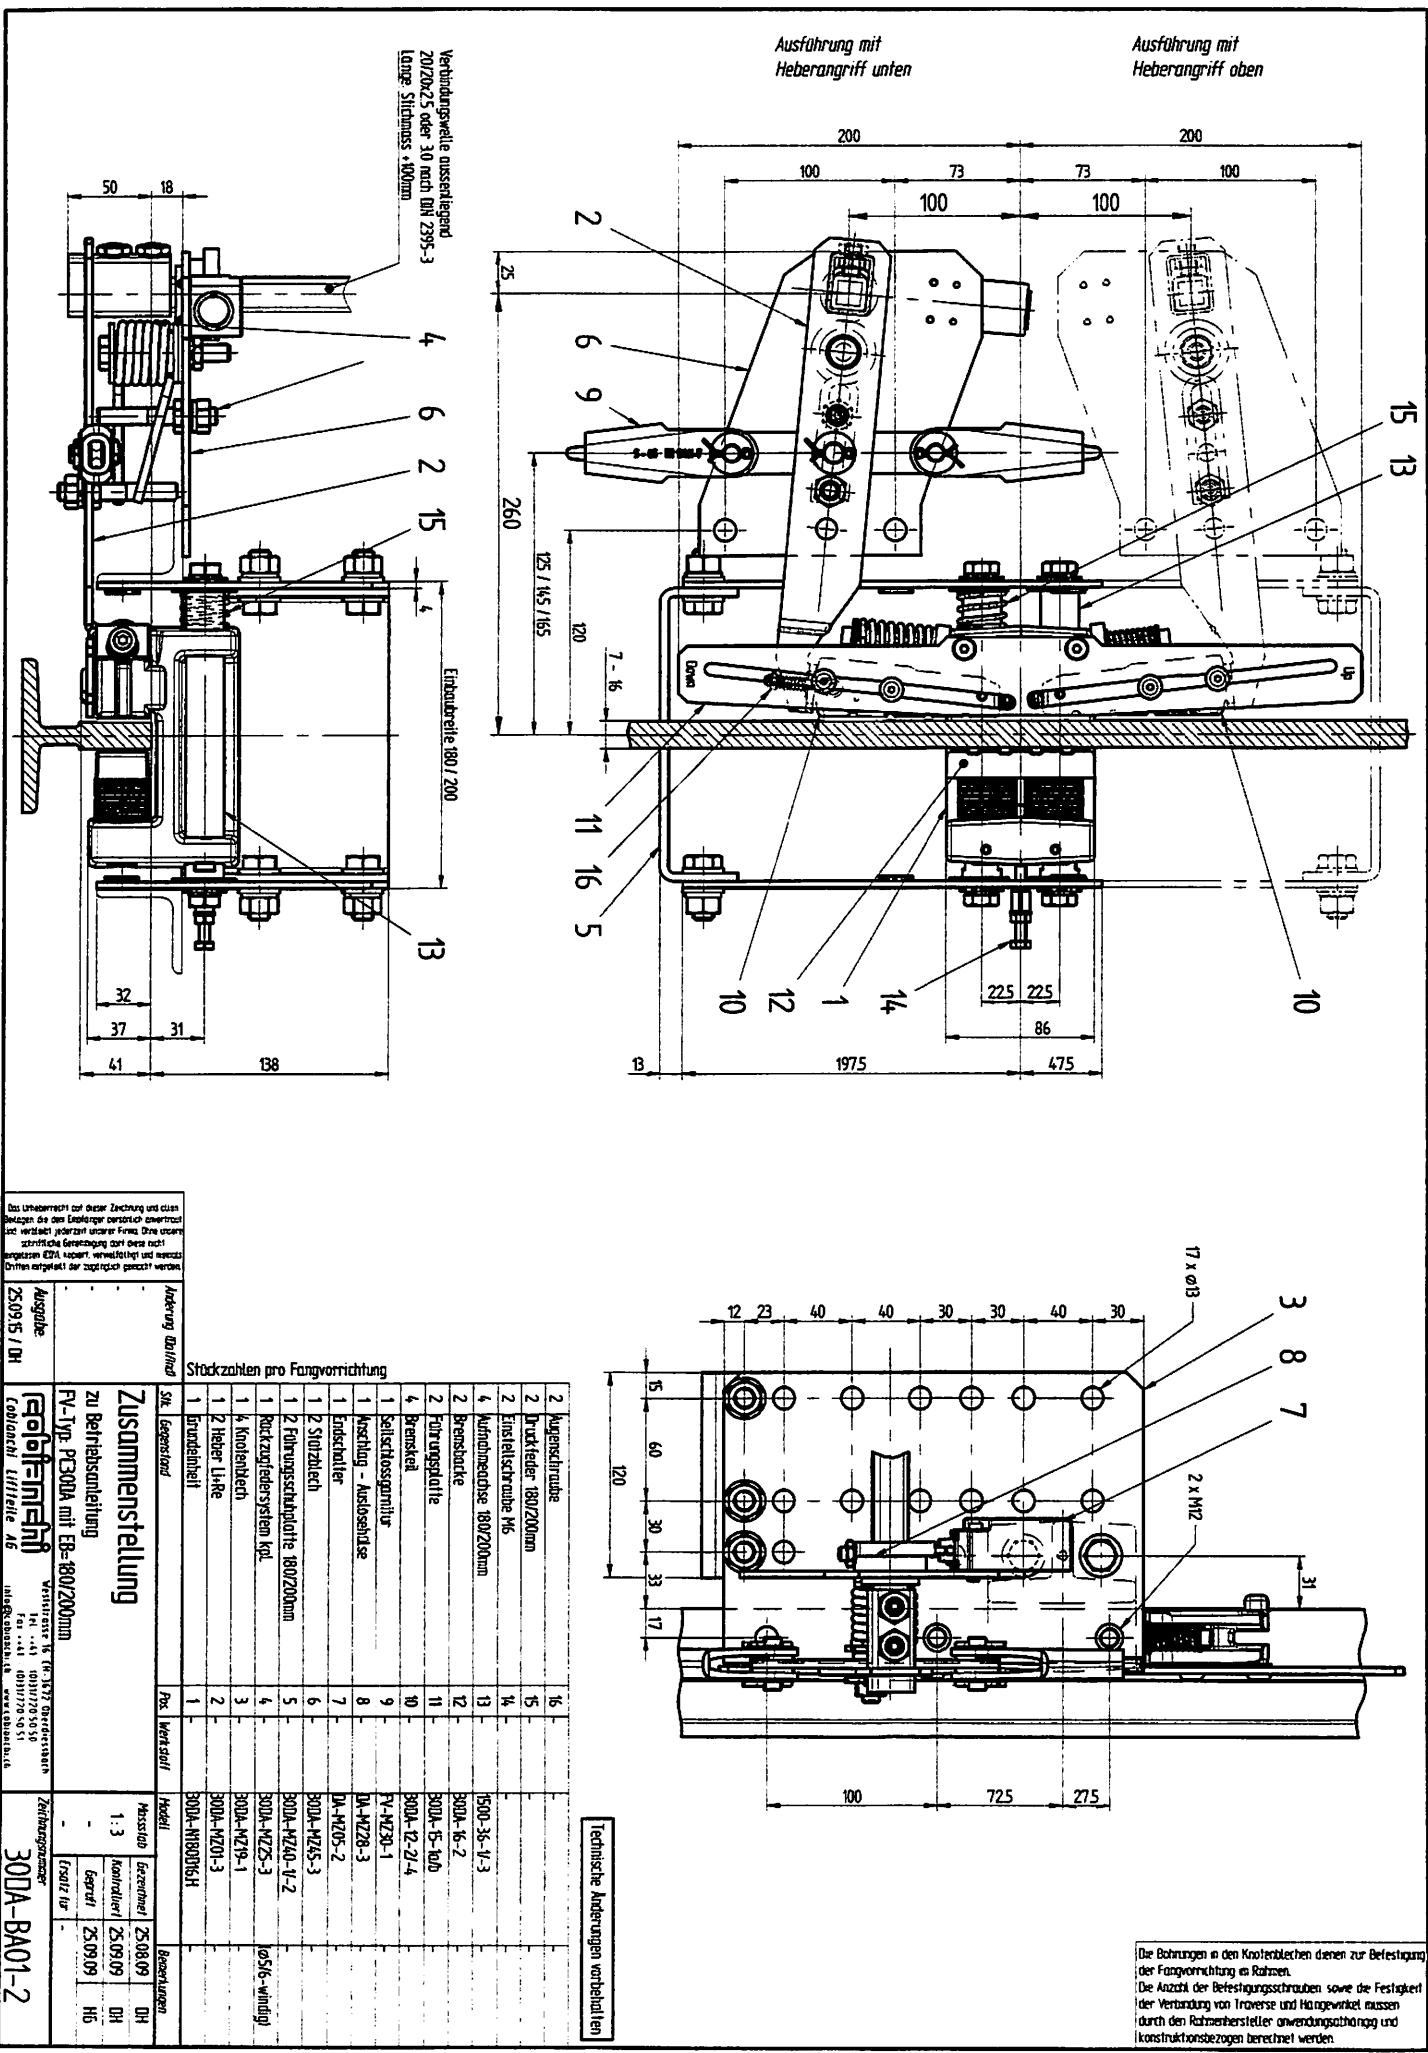

4.5. Guide-ways of cabin:

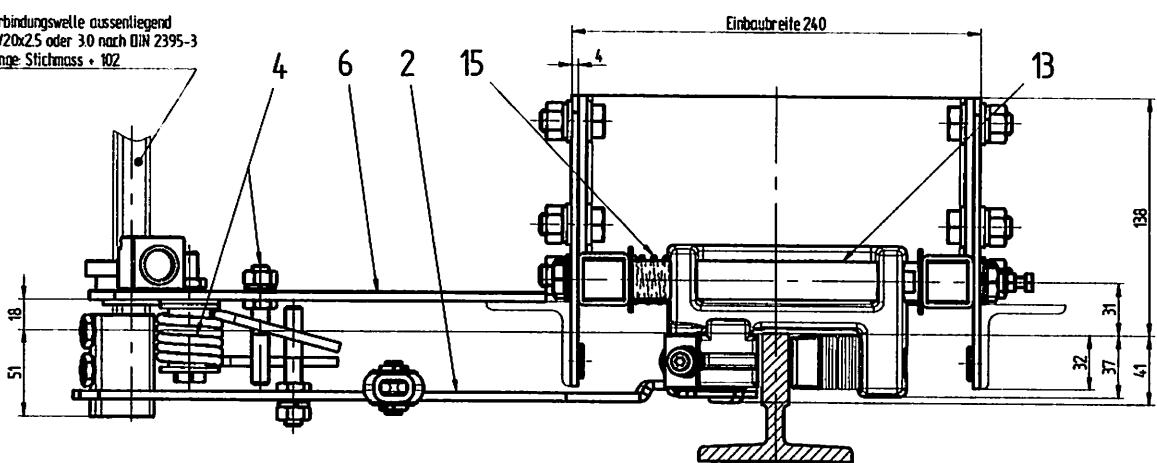

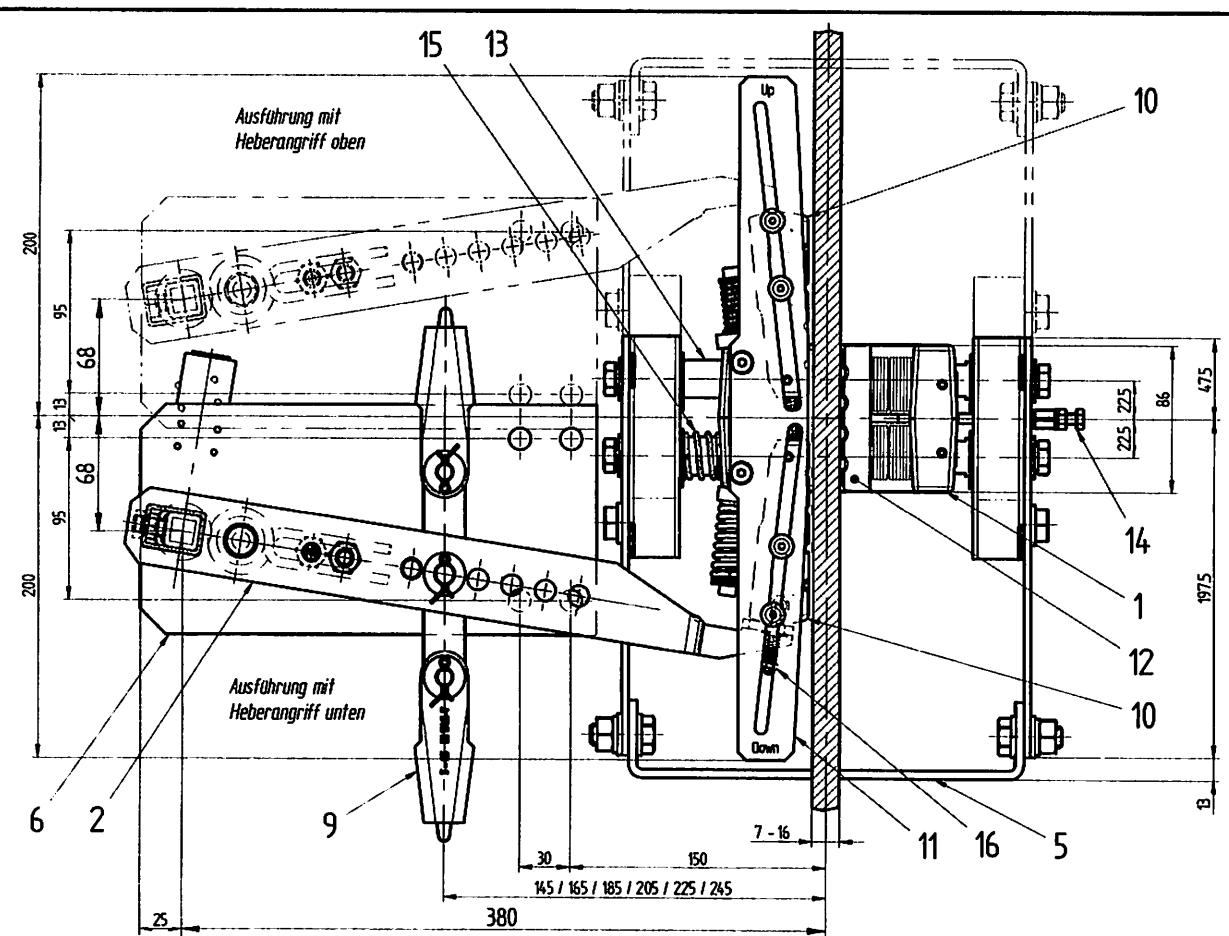

In an impeccable condition, not widened.

4.6. Cleanliness:

In general and in particular in the case of building construction elevators and conversions of existing installations: make sure that the safety gear heads (Pos. 1) are protected against contamination with plaster, concrete, cement, mortar, gravel or other materials. Contaminated safety gear heads have to be dismantled and cleaned.

If these simple instructions are followed, then the safety for the users of the elevator as well as for the installation company can be increased significantly.

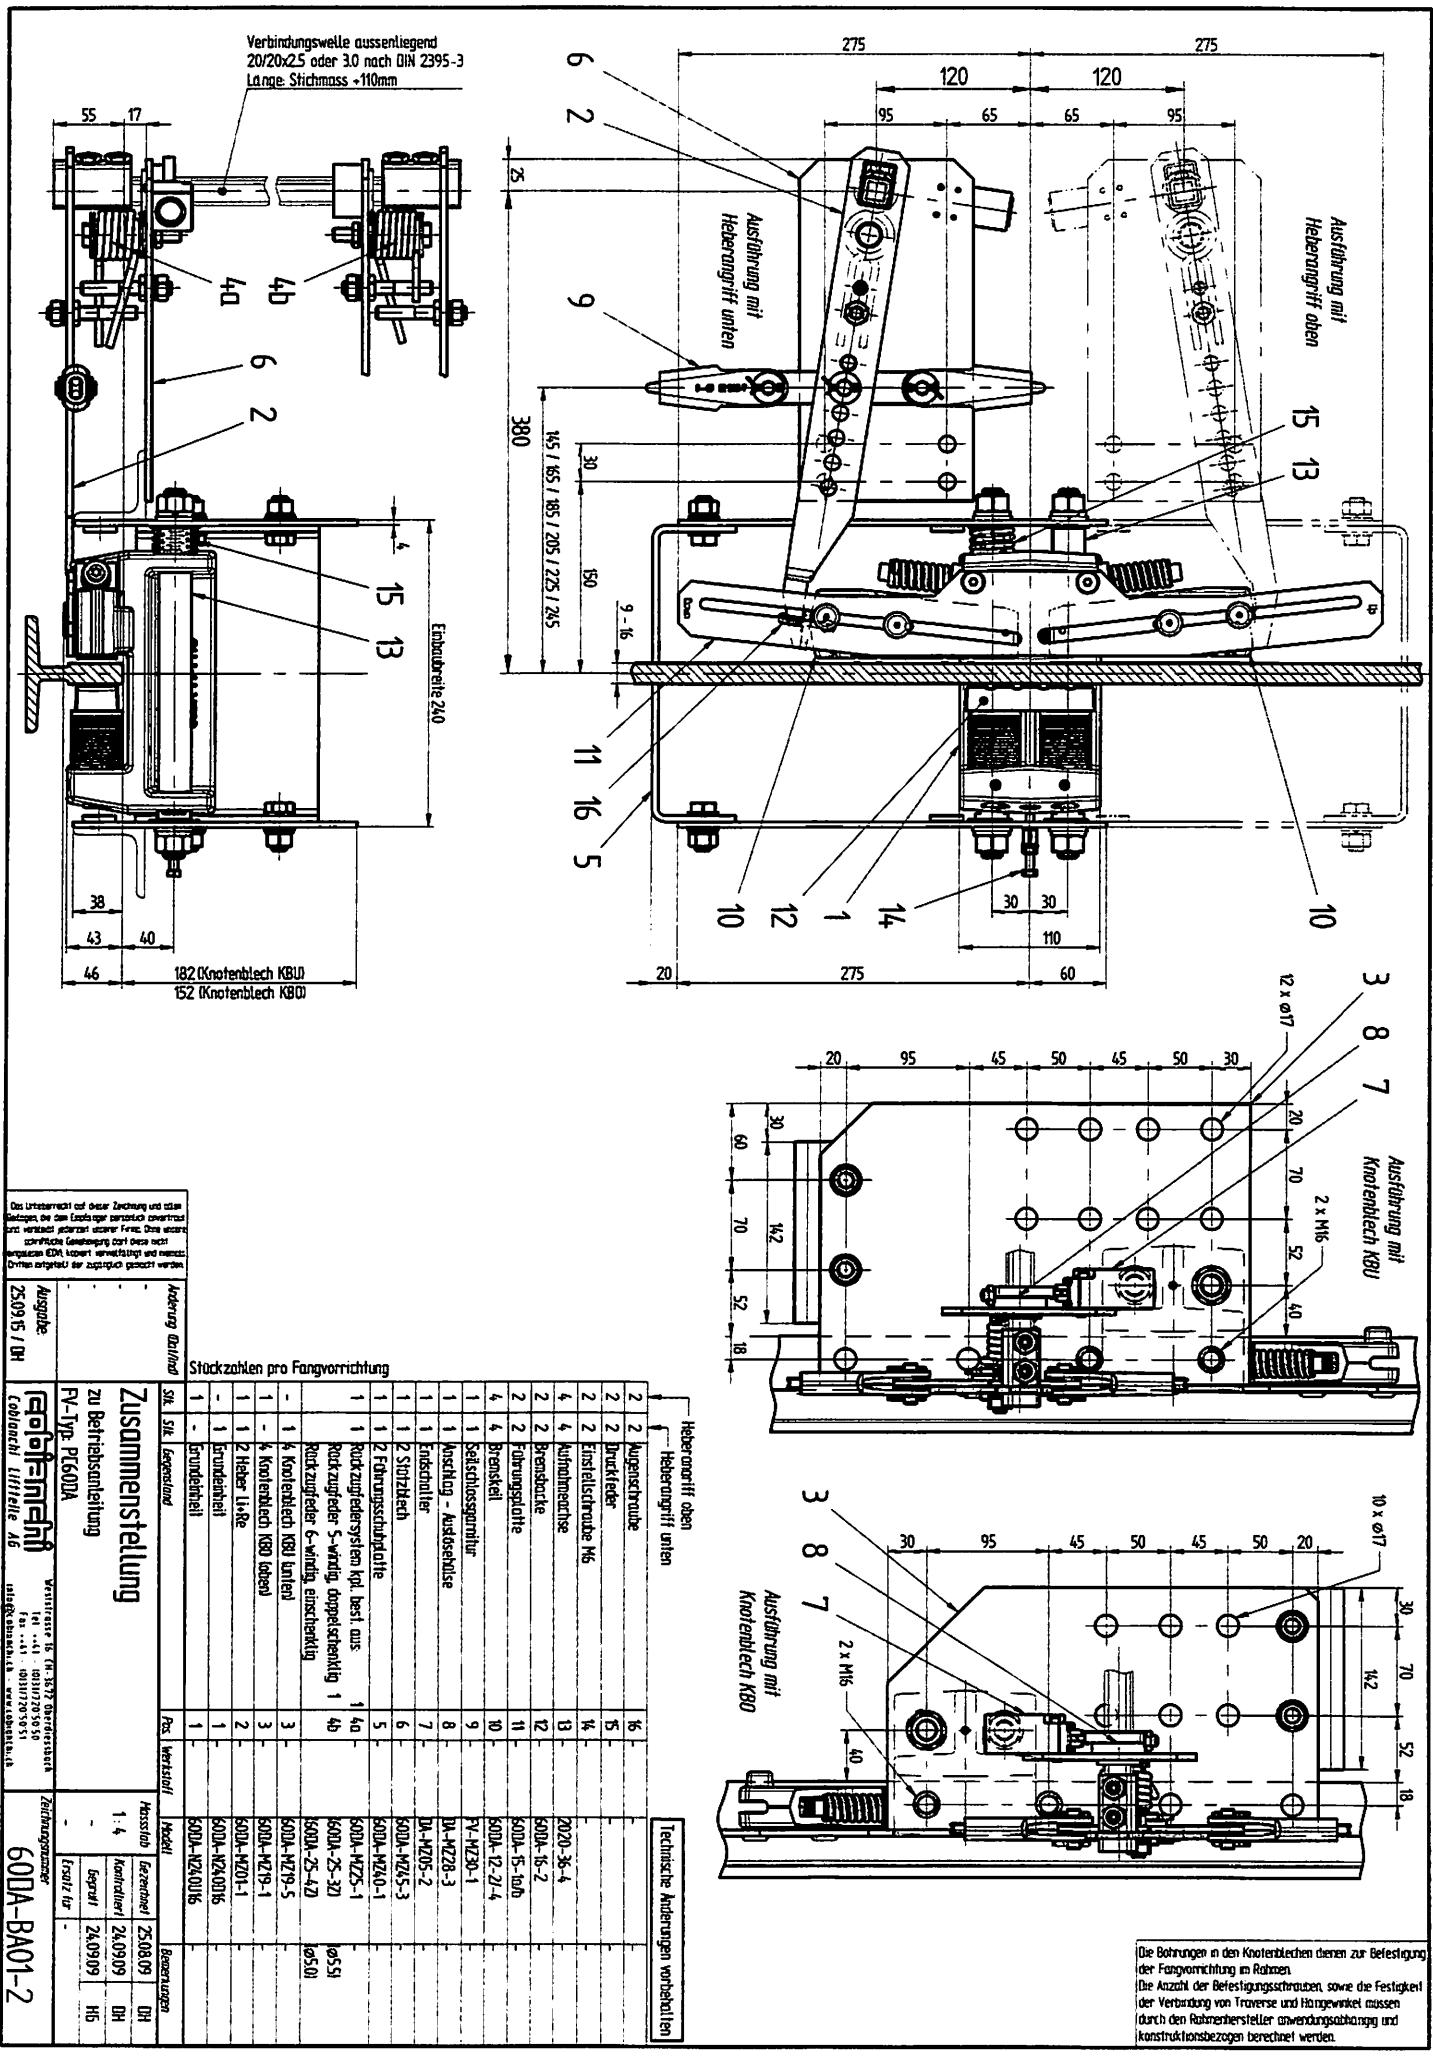

Das Unternehmen ist dieser Zeichnung und auch
dem Vertrag, in dem die Rechte der Betreiberin
zur Verwendung seiner Namen sowie einer unter-
schiedlichen Farbe bestimmt sind, sehr nahe.

This technical drawing illustrates a mechanical assembly, likely a component of a larger machine. The drawing includes several labeled parts and dimensions:

- Part 3: A vertical plate with 17 circular holes, each labeled $\varnothing 13$.
- Part 8: A horizontal plate with 7 circular holes, each labeled $\varnothing 13$.
- Part 7: A vertical plate with 2 circular holes, each labeled $M12$.
- Dimensions: Vertical dimensions include 30, 40, 30, 30, 40, 40, 23, 12, 15, 60, 30, 33, and 17. Horizontal dimensions include 120.
- Reference numbers: 31, 775, and 100 are also present on the right side of the drawing.
